

# TECH TIP

## Logging on the Touro Wireless Network

*BEFORE YOU CAN LOGIN TO THE WIRELESS NETWORK YOU MUST FIRST LOGIN TO THE TOURO WIRED NETWORK AND RESET YOUR PASSWORD.* You can do this from any of the computers in the library.

**IMPORTANT: All notebooks, laptops, etc., both Macs and PCs must have the latest version of Java installed in order to access the wireless network. It is suggested you update your Java before trying to connect as well as updating your operating system. It is also recommended that you install an anti-virus program.**

- Select Touro-802.1x from the list of wireless networks shown on your computer.
- Launch your browser (If you are asked to accept a certificate, do so):

You will then need to enter your network credentials.

Enter:

**USERNAME:** Use the same *user name* you use to login to the wired network and TouroOne Portal. Usually your first initial + your last name. If you have a first initial and last name combination that would indicate more than one person, you might have a number after your last name).

**PASSWORD:** Use the *same password* you used to login to the wired network

**NOTE:** Once you reset your password on the wired **network only you will know your password**, not the library staff and not the IT staff. **If you forget your password you will need to request that IT reset your password, which you will again be prompted to change on your next login.**
